

# **Windows File Copy Speeds Part 1**

**Dennis Martin**  
**President, [Demartek](#)**  
**June 2008**

# Introduction

- **Factors to consider in measuring file copy performance**
- **Some content courtesy of Microsoft**
- **Preliminary results – testing still underway**

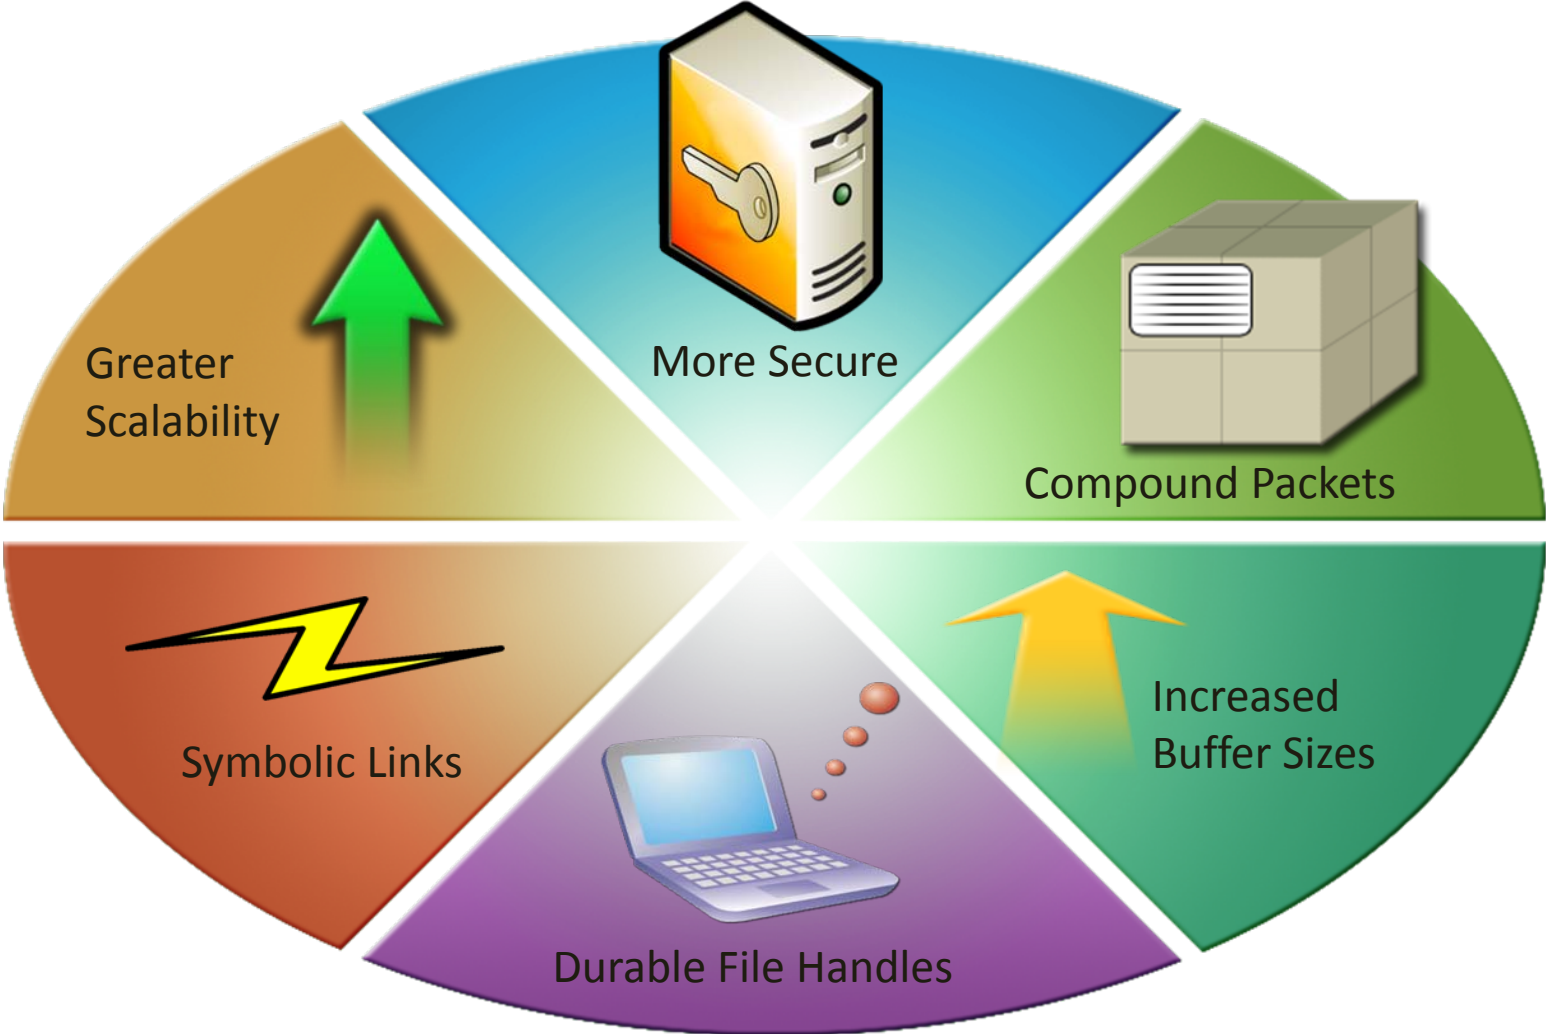

# Factors

- **Hardware factors in source and target**
  - Number of processors and cores
  - NIC cards and features
  - Disk storage access speeds
- **Network Factors**
  - Latency of network
  - Number of hops between switches
- **Software and file system factors**
  - Number of files
  - Size of files

# Limitations With SMB 1.0

- **SMB1.0 Limitations**
  - Considered “chatty”
  - Restrictive limits on number of open files, number of shares etc.
  - No support for durable handles
  - No support for symbolic links
  - Cumbersome security signing algorithms
  - Security issues
- **Rationale**
  - High % of servers deployed are for Windows file services

# Server Message Block (SMB) 2

Source: Microsoft

# SMB 2 Streaming Improvement

SMB 2.0 changes specifically improve WAN performance

**100ms RTT - WAN**

● Write Request

● Write Response

Pre-Vista

Vista

Download speed (Kb/s)

**30x Faster!**

Source: Microsoft

# Preliminary Results

- **Windows Vista Ultimate x64 SP1 as Source**
  - All Gigabit LAN (not a WAN in this test)
  - Source folder of mixed file types:
    - 57.8 GB (62,132,156,995 bytes)
    - 23,788 Files
    - 1,816 Folders
  - Time to Windows 2003 Server: 25 mins 15 secs
  - Time to Windows 2008 Server: 25 mins 30 secs
  - Targets were identical workstations
    - Pentium-D (1 processor, dual-core), 8GB RAM, SATA drives, x64 editions

# Testing Continues

- **Still testing various combinations of:**
  - Operating Systems (XP, Vista, Server 2003/2008)
  - Different server hardware, etc.
- **Stay tuned for Part 2 for more test cases...**
- **Any RMWTUG members with Internet connections interested in helping with tests?  
Please contact me.**
